Anti-TPO

For USA: Roche Diagnostics COBAS Elecsys Anti-TPO

English

System information

For cobas e 411 analyzer: test number 720
For MODULAR ANALYTICS E170, cobas e 601 and cobas e 602 analyzers: Application Code Number 137

Intended use

Immunoassay for the in vitro quantitative determination of antibodies to thyroid peroxidase in human serum and plasma. The anti-TPO determination is used as an aid in the diagnosis of autoimmune thyroid diseases.

The electrochemiluminescence immunoassay “ECLIA” is intended for use on Elecsys and cobas immunoassay analyzers.

Summary

Thyroid-specific peroxidase (TPO) is present on the microsomes of thyrocytes and is expressed at its apical cell surface. In synergy with thyroglobulin (Tg) the enzyme has an essential function in the iodination of L-tyrosine and the chemical coupling of the resulting mono- and di-iodotyrosine to form the thyroid hormones T4, T3, and rT3.

TPO is a potential autoantigen. Elevated serum titers of antibodies to TPO are found in several forms of thyroiditis caused by autoimmunity. The frequently found term "microsomal antibody" originates from the time when TPO had not yet been identified as an antigen in autoimmunity caused by microsomes. In the clinical sense the two terms anti-TPO and microsomal antibody can be used synonymously; there are differences, however, with regard to the test methods.

High anti-TPO titers are found in up to 90% of patients with chronic Hashimoto's thyroiditis. In Graves' disease, 70% of the patients have an elevated titer. Although the sensitivity of the procedure can be increased by simultaneously determining other thyroid antibodies (anti-Tg, TSH-receptor-antibody - TRAb), a negative finding does not rule out the possibility of an autoimmune disease. The magnitude of the antibody titer does not correlate with the clinical activity of the disease. Initially elevated titers can become negative after lengthy periods of illness or during remission. If antibodies reappear following remission, then a relapse is probable.

Whereas the usual microsomal antibody tests employ unpurified microsomes as an antigen preparation, the anti-TPO tests use a purified peroxidase. The two procedures are of comparable performance in terms of clinical sensitivity, but better lot-to-lot consistency and higher clinical specificity can be expected from anti-TPO tests due to the higher quality of the antigen used.

Recombinant antigen and polyclonal anti-TPO antibodies are used in the Elecsys Anti-TPO assay.

Test principle

Competition principle. Total duration of assay: 18 minutes.

- 1st incubation: 20 µL of sample are incubated with anti-TPO-antibodies labeled with a ruthenium complex.
- 2nd incubation: After addition of biotinylated TPO and streptavidin-coated microparticles, the anti-TPO antibodies in the sample compete with the ruthenium-labeled anti-TPO antibodies for the biotinylated TPO antigen. The entire complex becomes bound to the solid phase via interaction of biotin and streptavidin.
- The reaction mixture is aspirated into the measuring cell where the microparticles are magnetically captured onto the surface of the electrode. Unbound substances are then removed with ProCell/ProCell M. Application of a voltage to the electrode then induces chemiluminescent emission which is measured by a photomultiplier.

- Results are determined via a calibration curve which is instrument-specifically generated by 2-point calibration and a master curve provided via the reagent barcode or e-barcode.

a) Tris(2,2'-bipyridyl)ruthenium(II)-complex (Ru(bpy)²⁺)

Reagents - working solutions

The reagent pack is labeled as A-TPO.

M Streptavidin-coated microparticles (transparent cap), 1 bottle, 6.5 mL:
Streptavidin-coated microparticles 0.72 mg/mL; preservative.
R1 Anti-TPO-Ab-Ru(bpy)²⁺ (gray cap), 1 bottle, 9 mL:
Polyclonal anti-TPO antibody (sheep) labeled with ruthenium complex 1.0 mg/mL; TRIS buffer 100 mmol/L, pH 7.2; preservative.
R2 TPO-biotin (black cap), 1 bottle, 9 mL:
Biotinylated TPO (recombinant) 0.15 mg/L; TRIS buffer 30 mmol/L, pH 7.0; preservative.

Precautions and warnings

For in vitro diagnostic use.
Examine the normal precautions required for handling all laboratory reagents.
Disposal of all waste material should be in accordance with local guidelines.
Safety data sheet available for professional user on request.
For USA: Caution: Federal law restricts this device to sale by or on the order of a physician.
Avoid foam formation in all reagents and sample types (specimens, calibrators and controls).

Reagent handling

The reagents in the kit have been assembled into a ready-for-use unit that cannot be separated.
All information required for correct operation is read in from the respective reagent barcodes.

Storage and stability

Store at 2-8 °C.

Do not freeze.

Store the Elecsys reagent kit upright in order to ensure complete availability of the microparticles during automatic mixing prior to use.

Stability:

- unopened at 2-8 °C up to the stated expiration date
- after opening at 2-8 °C 6 weeks
- on the analyzers 2 weeks

Specimen collection and preparation

Only the specimens listed below were tested and found acceptable.

1. Serum collected using standard sampling tubes or tubes containing separating gel.
2. Serum collected using standard sampling tubes or tubes containing separating gel.
3. Serum collected using standard sampling tubes or tubes containing separating gel.
4. Serum collected using standard sampling tubes or tubes containing separating gel.
5. Serum collected using standard sampling tubes or tubes containing separating gel.
6. Serum collected using standard sampling tubes or tubes containing separating gel.
7. Serum collected using standard sampling tubes or tubes containing separating gel.

Criterion: Recovery within 90-110 % of serum value or slope 0.9-1.1 + intercept within ± 2x analytical sensitivity (LDL) + coefficient of correlation > 0.95.

Stable for 3 days at 2-8 °C, 1 month at -20 °C. Freeze only once.

The sample types listed were tested with a selection of sample collection tubes that were commercially available at the time of testing, i.e. not all available tubes of all manufacturers were tested. Sample collection systems
Anti-TPO

from various manufacturers may contain differing materials which could affect the test results in some cases. When processing samples in primary tubes (sample collection systems), follow the instructions of the tube manufacturer. Centrifuge samples containing precipitates before performing the assay. Do not use heat-inactivated samples. Do not use samples and controls stabilized with azide. Ensure the samples, calibrators and controls are at 20-25 °C prior to measurement. Due to possible evaporation effects, samples, calibrators and controls on the analyzers should be analyzed/measured within 2 hours.

Materials provided
See “Reagents – working solutions” section for reagents.

Materials required (but not provided)
- **cubas e 411 analyzer:**
  - 04672931190, Anti-TPO CalSet, for 4 x 1.5 mL
  - 05042666191, PreciControl ThyroAB, for 4 x 2.0 mL
  - 11732277122, Diluent Universal, 2 x 16 mL sample diluent
  - 03183971122, Diluent Universal, 2 x 36 mL sample diluent
  - General laboratory equipment
  - MODULAR ANALYTICS E170 or cubas e analyzer

Accessories for cubas e 411 analyzer:
- 11662988122, ProCell, 6 x 380 mL system buffer
- 11662970122, CleanCell, 6 x 380 mL measuring cell cleaning solution
- 11930346122, Elecsys SysWash, 1 x 500 mL washwater additive
- 11933159001, Adapter for SysClean
- 11706802001, AssayCup, 60 x 60 reaction cups
- 11706799001, AssayTip, 30 x 120 pipette tips
- 1180057001, Clean-Liner

Accessories for MODULAR ANALYTICS E170, cubas e 601 and cubas e 602 analyzers:
- 04808340190, ProCell M, 2 x 2 L system buffer
- 04808293190, CleanCell M, 2 x 2 L measuring cell cleaning solution
- 03023141001, PC/CC-Cups, 12 cups to prewarm ProCell M and CleanCell M before use
- 03005712190, ProbeWash M, 12 x 70 mL cleaning solution for run initialization and rinsing during reagent change
- 12102137001, AssayTip/AssayCup, 48 magazines x 84 reaction cups or pipette tips, waste bags
- 03023150001, WasteLiner, waste bags
- 03027651001, SysClean Adapter M

Accessories for all analyzers:
- 11298500316, ISE Cleaning Solution/Elecsys SysClean, 5 x 100 mL system cleaning solution
- 11298500160, ISE Cleaning Solution/Elecsys SysClean, 5 x 100 mL system cleaning solution (for USA)

Assay
For optimum performance of the assay follow the directions given in this document for the analyzer concerned. Refer to the appropriate operator’s manual for analyzer-specific assay instructions. Resuspension of the microparticles takes place automatically prior to use. Read in the test-specific parameters via the reagent barcode. If in exceptional cases the barcode cannot be read, enter the 15-digit sequence of numbers (except for the cubas e 602 analyzer). Bring the cooled reagents to approximately 20 °C and place on the reagent disk (20 °C) of the analyzer. Avoid foam formation. The system automatically regulates the temperature of the reagents and the opening/closing of the bottles.

Calibration
Traceability: This method has been standardized against the NIBSC (National Institute for Biological Standards and Control) 66/387 Standard. Every Elecsys reagent set has a barcoded label containing specific information for calibration of the particular reagent lot. The predefined master curve is adapted to the analyzer using the relevant CalSet. Calibration frequency: Perform calibration on all analyzers as follows:
- with every reagent kit
- renewed calibration on all analyzers:
  - daily: when using the same reagent kit on the analyzers
  - as required: e.g. quality control findings outside the defined limits

Quality control
For quality control, use PreciControl ThyroAB. In addition, other suitable control material can be used. Controls for the various concentration ranges should be run individually at least once every 24 hours when the test is in use, once per reagent kit, and following each calibration. The control intervals and limits should be adapted to each laboratory’s individual requirements. Values obtained shall fall within the defined limits. Each laboratory should establish corrective measures to be taken if values fall outside the defined limits.

If necessary, repeat the measurement of the samples concerned. Follow the applicable government regulations and local guidelines for quality control.

Calculation
The analyzer automatically calculates the analyte concentration of each sample (either in IU/mL or kIU/L).

Limitations - interference
The assay is unaffected by icterus (bilirubin < 1129 μmol/L or < 66 mg/dL), hemolysis (Hb < 0.93 mmol/L or < 1.5 g/dL), Lipemia (triglycerides < 23.9 mmol/L or < 2100 mg/dL) and bilirubin (< 40.9 nmol/L or < 10 ng/mL).

Criterion: Recovery within ± 10 % of initial value. Samples should not be taken from patients receiving therapy with high bilirubin doses (i.e. > 5 mg/dL) until at least 8 hours following the last bilirubin administration.

No interference was observed from rheumatoid factors up to a concentration of 1500 IU/mL. In vitro tests were performed on 23 commonly used pharmaceuticals. No interference with the assay was found.

In rare cases, interference due to extremely high titers of antibodies to analyte-specific antibodies, streptavidin or ruthenium can occur. These effects are minimized by suitable test design.

For diagnostic purposes, the results should always be assessed in conjunction with the patient’s medical history, clinical examination and other findings.

Limits and ranges

<table>
<thead>
<tr>
<th>Measuring range</th>
<th>5.00-600 IU/mL (defined by the lower detection limit and the maximum of the master curve). Values below the lower detection limit are reported as &lt; 5.00 IU/mL. Values above the measuring range are reported as &gt; 600 IU/mL.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Lower limits of measurement</td>
<td>Lower detection limit: &lt; 5.00 IU/mL. The lower detection limit represents the lowest analyte level that can be distinguished from zero. It is calculated as the value lying two standard deviations above that of the lowest standard (master calibrator, standard 1 + 2 SD, repeatability study, n = 21).</td>
</tr>
<tr>
<td>Dilution</td>
<td>Samples with anti-TPO concentrations above the measuring range can be diluted manually with Diluent Universal. The recommended dilution is 1:5. The concentration of the diluted sample must be &gt; 200 IU/mL. After dilution, multiply the result by the dilution factor.</td>
</tr>
</tbody>
</table>
Anti-TPO

Please note: The autoantibodies are heterogeneous and this gives rise to non-linear dilution phenomena for individual samples.

Expected values

Extended studies with the Elecsys Anti-TPO assay performed on samples from 208 healthy test subjects in 3 clinical centers in Austria and Germany showed a borderline value of 34 IU/mL for 95 % of the results. For detailed information about reference intervals in children, adolescents and pregnant women, refer to the brochure "Reference Intervals for Children and Adults", English: [here] 04640292, German: [here] 04625889.

This booklet also contains results of a detailed study about influencing factors on thyroid parameters in a well characterized reference group of adults. Different inclusion and exclusion criteria were applied (e.g. sonographic results (thyroid volume and density) as well as criteria according to the guidelines of the National Academy of Clinical Biochemistry - NACB).

Each laboratory should investigate the transferability of the expected values to its own patient population and if necessary determine its own reference ranges.

Specific performance data

Representative performance data on the analyzers are given below. Results obtained in individual laboratories may differ.

Precision

Precision was determined using Elecsys reagents and pooled human sera (repeatability: n = 21, intermediate precision: n = 21); total precision on MODULAR ANALYTICS E170 analyzer was determined in a modified protocol (EP5-A) of the CLSI (Clinical and Laboratory Standards Institute): 6 times daily for 10 days (n = 60). The following results were obtained:

<table>
<thead>
<tr>
<th>cobas e 411 analyzer</th>
<th>MODULAR ANALYTICS E170, cobas e 601 and cobas e 602 analyzers</th>
</tr>
</thead>

Method comparison

A comparison of the Elecsys Anti-TPO assay (y) with a commercially available anti-TPO test (x) using clinical samples gave the following correlations:

Number of samples measured: 50

Passing/Bablok®

Linear regression

\[ y = 0.77x + 2.94 \]

\[ y = 0.63x + 17.1 \]

\[ t = 0.785 \]

\[ r = 0.899 \]

The sample concentrations were between approximately 12 and 460 IU/mL.

Analytical specificity

No influence with human autoantibodies to thyroglobulin (< 394 IU/mL) was detectable.

References

For further information, please see the appropriate operator's manual for the analyzer concerned, the respective application sheets, the product information and the Method Sheets of all necessary components (if available in your country).

A point (period/stop) is always used in this Method Sheet as the decimal separator to mark the border between the integral and the fractional parts of a decimal numeral. Separators for thousands are not used.

Symbols

Roche Diagnostics uses the following symbols and signs in addition to those listed in the ISO 15223-1 standard (for USA: see https://usdiagnostics.roche.com for definition of symbols used):
FOR US CUSTOMERS ONLY: LIMITED WARRANTY
